PATENT ANALYSIS AND SEARCHING TECHNIQUES

Project Report Submitted in partial fulfilment of Bachelor of

Technology

in
Information Technology

By

Akanksha Varshney(191547)

Under the Supervision of

Dr. Ravindara Bhatt

To

Department of Information Technology

Jaypee University of Information Technology, Solan

Himachal Pradesh (173234)

CERTIFICATE

Candidate's Declaration

I hereby declare that the work presented in this report entitled "Patent Analysis and searching techniques" in partial fulfillment of the requirements for the award of the degree of Bachelor of Technology in Computer Science and Engineering/Information Technology submitted in the department of Computer Science & Engineering and Information Technology, Jaypee University of Information Technology Waknaghat is an authentic record of my own work carried out over a period from July 2022 to May 2023 under the supervision of Dr. Ravindara Bhatt(Associate Professor, CSE department).

The matter embodied in the report has not been submitted for the award of any other degree or diploma.

(Student Signature)

Akanksha Varshney, 191547

This is to certify that the above statement made by the candidate is true to the best of my knowledge.

(Supervisor Signature)

Dr. Ravindara Bhatt

ACKNOWLEDGEMENT

An individual generally needs somebody who inspires them to achieve great feats in life, I would like to offer my gratitude to such amazing individuals who helped me and guided me during my journey.

I would like to thank my supervisor **Mr. Anuj Sharma** for his consistent help and direction all through my preparation. He has been a steady support and mentor in these six months of training. Without his assistance it would have been significantly troublesome to understand the idea driving the industrial training.

A very special thanks goes to my mentor and guide during these college years **Dr. Ravindara Bhatt** for his constant support and guidance that will always be a beacon of inspiration in my life. His constant assistances have made me excel in various fields and guided me in difficult times to achieve great success.

I would likewise prefer to extend my gratitude to the Information Technology Department for their consistent and sacrificial help towards finishing this undertaking to the best of my abilities.

Thank you

ABSTRACT

This report depicts an elaborate plan on the process of patent analysis and searching. Here, basics of Intellectual Property Rights are elucidated and diverse forms of Intellectual property, Patents, claims, filing applications and searching techniques are also mentioned. The report deep dives into a case study which presents a client who has developed a gene therapy product for Retinal dystrophy. A patentability analysis is done on the invention that is the gene therapy product, to check its novelty. The gene therapy product is a treatment based on adeno-associated virus type 2 (AAV2) in which a proper copy of the RPE65 gene is delivered without disrupting the genome. This concoction is injected directly into the retina to enter the retinal cells. When RPE65 is expressed in those cells, it can do its job and, in essence, stop the progression of the disease. Various searching queries are performed on Orbit and NPLs are performed on Google, Google scholar or science direct for the analysis. The most relevant patent is found and mapped for the client. Patent analysis helps to increase the scope of scientific innovation. It gives the inventor or creator the alternative of preventing somebody else from assembling, duplicating or selling of the patented merchandise without consent of the patent holder. It motivates the inventor with a form of incentive and thus, helps to keep the flame of innovation alive causing greater revelations for a better future.

CHAPTER 1

INTRODUCTION

1. Introduction to intellectual property

1.1 Intellectual Property

It is the intangible property, produced by creation of the mind that holds the legal rights to be protected by law for its recognition and financial benefits and is said to be the property of the inventor or creator and is called intellectual property. According to intellectual property law the owners of such intellectual property are given special rights over their invention which may include publishing, licensing, manufacturing, distribution and suing in the case of copying or infringement.

1.2 Intellectual Property Rights (IPR)

These refer to the exclusive set of rights that are granted to the owner of the intellectual property for commercial exploitation under provisions of national laws and international agreements. The IP to be protected belongs to domains like scientific, industrial, artistic or literally. These rights can either be assigned or licensed for monetary benefits.

The objective of IPR is to promote progress in the fields of invention so that mankind can reach greater heights. There is an exchange of rights over creative inventions so that the inventors or authors can get incentives over their amazing ideas and implementation. The inventor can benefit from that creation and is motivated to be more inventive.

The advantages of IPR are:

- It encourages innovation and sharing of knowledge
- It also helps to encourage and protect the creator
- It helps the invention to get commercialized and makes new inventions more mainstream

1.3   Types of IPR

It is broadly of two types of industrial property and copyright. Industrial property usually deals with inventions and investment designs used in the industry whereas copyright deals with artistic creations like music paintings sculptures computer programs books and movies.

1.3.1   Patent:

It lays down selective legitimate rights permitted by the government to the owner of patent for a limited time period on the terms of revealing of the invention to the society in open space. Patents are offered for an invention which includes a product or innovation/improvement in a product. The validity period of a patent is 20 years.

1.3.2   Copyright:

It includes collection of rights which provide legal means for protecting author's(composers, writers etc.) work and allows him to reproduce the work for a limited time span. When an individual creates an artistic piece of work such as original literary, musical, dramatic, artistic work etc. then the creator is free to decide its use and the destiny of the work. Therefore, by the laws of intellectual property rights their work is protected by copyright. The idea itself is not protected but the way the idea is presented in the form of a product is Scope of copyright includes both (i) moral rights – Right of authorship and Right of

Integrity, (ii) economic rights – Right to reproduce work, Right of Distributing and Right of Communication to the Public. The validity of copyrights life time of author and 50 years after death.

1.3.3 Trademark:

A specific sign or marketing logo or graphic that is connected to a specific company or business is called a trademark. Its main purpose is to create a brand value and makes it easy to differentiate between brands. A trademark will have a specific symbol, phrase, logo, picture or a combination of multiple features. It can also have a specific sound shape or color. It is of three categories unregistered trademark, and registered service mark, registered trademark. It's misuse by others of registered trademark holder without permission will lead to infringement and liable for prosecution. The trademark is registered for 10 years and can be renewed timely on payment of renewal fee.

1.3.4 Trade secret:

Any formula, recipe, pattern, process or information that is a secret or not present in the public domain is called a trade secret. This information being leaked can cause competitors and consumers to take economic advantage over a company therefore it is also referred to as confidential information. It can be any idea, data, experimental results, manufacturing process, recipe, chemical formula etc. which is being kept as a secret by a person or company by signing confidential agreements with business partners. There is restricted entry into the area where trade secret work is done by using protective techniques like digital security tools. In the field of biotechnology trade secrets include production process, microbial strains or cell lines as well as the very infamous secret formula of Coca Cola

1.3.5 Geographical Indication:

The protection rights are provided to a particular community in a geographical area for producing goods/products that hold characteristics of that specific area due to its climatic conditions. Geographical indication. All the specific sign or name that indicates the geographical location of the product. Examples include; Darjeeling tea, Mysore silk, Kullu shawl etc. Geographical Indication is registered for 10 years and can be renewed timely on payment of renewal fee.

1.3.6   Design layouts of circuits

The layouts of various circuits are also an invention and various types of designs help in increasing the efficiency of circuits. Therefore, in order to stop the copying of these circuit designs they are protected by intellectual property rights.

1.3.7   Industrial designs

Industrial designs are widely applied to various products such as mobile phones, luxury items, watches, house wares as well as buildings and vehicles. Therefore, intellectual property rights also protect the visual design of various objects available in the market by exercising the rights to industrial designs. Designs, in general, add appeal and brand value two any product available in the market therefore protecting it is essential.

1.3.8   Patents

An exclusive right which is provided to the developer of an invention, product or a process is called a patent. This provides protection to the invention for a period of 20 years. The owner of the patent has a right to give permission to use their invention and can also trade or sell the rights of their invention to somebody else. If a patient expires then it enters the public domain and can be commercially exploited by anybody. An invention needs to fulfill certain criteria to be termed patentable. The patent can only be granted in the case of developing a non-

obvious process, machine or product that is novel, useful or improves the prior process or product. It restricts others from imitating or manufacturing that particular product.

Advantages:

- Restricts competitors
- Provides monetary benefits
- Product credibility
- Keep others out of the market

Disadvantages:

- High cost for the maintenance of patent.
- Liability
-

1.4 Different types of patents:

1.4.1 Utility patent

Any useful invention that is not obvious in its field can be called a utility Patent. Utility patents usually can be of five categories which includes a process, machine, manufacturing, composition of matter and improvements in an already existing idea. Examples include computer hardware, cosmetics, chemical formula, computer software, house wares etc

1.4.2 Design patent

Creating a unique design or pattern of a device, or a product can help to get a design patent. Examples include a specific architectural design, design of

furniture, wallpaper, devices etc. A design patent only lasts for 14 years after its issue.

1.4.3 Plant patent

A plant is given to an inventor who is able to discovered, invent or asexually produce a new species or variety of plant. It also lasts for 20 years from the date of filing the application and gives the reproducing rights exclusively to the inventor.
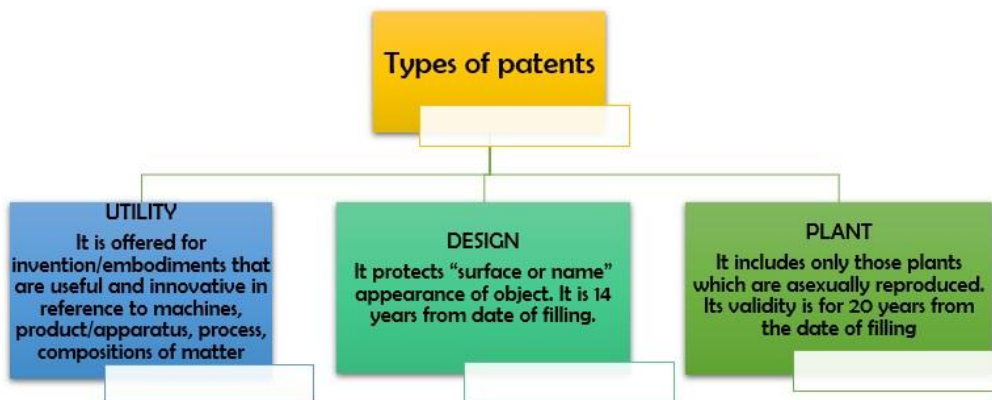

Figure-1 Types of Patents

1.5 Criteria for Patentability

1.5.1 Novelty:

Any invention must be a new process or product which means that it should be original and never seen or done before. It must involve nuances that have never been explored and extend the reach of existing knowledge. Novel inventions are a

patentability requirement. Novelty specifies that if public disclosure has already been made it is not eligible for patentability. To make sure that the invention is new inventors should do patent searching before filing application.

1.5.2 Non-obviousness and Inventive step:

The invention should be non-obvious which means that it should have a certain level of innovation in order to be patentable. The invention should not appear obvious to a person of the field in which the invention is being done. The obviousness of the invention can be tested by identifying the closest prior art and understanding the technical problem that the invention is trying to solve, then an analysis can be made if the invention is obvious in that particular field of use or not. The examiner in the office of patent will review published application of patent closest to the invention for which patent protection is asked for. If the examiner successfully finds the combination of prior art for the invention, it will be rejected as it would obvious combination of items only.

1.5.3 Utility:

The subject matter of patent should be useful to the society. The patent can only be granted to a specific invention which has applications in the industry not a private or personal ecosystem. If the invention is able to improve a particular process, product or machinery then it is able to put itself in industrial application

1.6 Paris Convention:

An international treaty (1883) that permits the applicants to file a 1st application in his or her own respective country and is considered to as priority document and the respective date on which it is filed is known as priority date. The advantage is that 12 months period is provided to the applicant in which he can seek funding and perform market research for product commercialization. Within that time

period a Paris Convention Application can be filed in any of the respective states claiming same priority date. A delay of 12 months allows the applicant to decide in which country protection is to sought.

1.7   Patent Corporation Treaty (PCT)

The international treaty (1970) which allows an inventor to get patent granted simultaneously in many nations by registering only one international patent application rather than filling the same in all national patent offices. More than 150 Contracting States are part of this treaty.

Steps in filling:

An international application is filed in single language in the Receiving Office (RO) with PCT formality requirements which is to be done within 12 months of filling local application.

An International Search is executed by "ISA" International Searching Authority within 16 months of filling in home country.

International Publication is done within 18 months from filling in home country. Supplementary International Search within 22 months and International Preliminary Examination within 28 months of filling are optional.

After the termination of PCT procedure, 30 months from primary filling date of first patent application, priority date can be claimed by the applicant and pursue grant of patent in regional patent offices of countries in that he wants to claim.

Role of World Intellectual Property Organization (WIPO) in PCT

PCT is administered by WIPO. PCT assembly, PCT working Group and meeting of International Authorities is also organized by WIPO. For each application filled for PCT, It plays a major role for accepting and storing all patent application papers, conducting examination, provides coordination of PCT procedure, communication patent documents to patent offices and third party, translation sections of application into French or English wherever it is necessary.

Non-Patentable Things:

- Inventions contrary to natural laws
- Opposing public command or ethics
- Causing injury to living beings and environment
- Mental Process
- Computer Software
- Abstract ideas
- Basic intermixture resulting only in aggregation of properties of components
- Method of doing business

Application Sections:

- Claims
- Title
- Abstract
- Summary
- Brief drawing description
- Background
- Drawing
- Field of invention
- Detailed drawing description.

1.8 Diverse methods in the process of patent filing

1.8.1 Kinds of Patent Applications

- **Provisional application:**

It is a type of temporary filling and is done when the invention is not complete or is still under development. This application includes the specific qualities of the invention along with a description and a diagram of the invention if required. The date of filing a provisional application is not a part of the 20 years lifespan of a patent.

Filing a provisional application comes with its own advantages like:

- It helps in easily getting an official date of filing and helps to preserve the idea of the invention
- It helps to provide a delay of 1 year for the inventor to finalize his or her invention
- It helps to give the inventor an extra year of protection for their patent/invention
- By filing the provisional application, the invention turns into to a practical patentable product

- **Ordinary application:**

It is the principal or 1st application for patent documented inside the Patent and Trademark Office Database. It is a type of application which does not have a Priority application and it does not have a reference application on the process. this type of application has specific qualities of the invention mentioned along with proper claim.

- **Conventional application:**

To claim priority in all convention countries conventional application is filed and the priority can be claimed by the applicant if exact application is filed in either of the convention country. The partner degree individual should apply their application in the patent office inside a year from the date of beginning application inside the conventional nation.

- **PCT-International application:**

This type of application can be validated in about 142 Nations and it falls under the patent cooperation treaty there's nothing known as a 'world patent'. The application doesn't offer for the award of a world patent, it simply gives an effective technique to the application strategy in a few nations at consistent time. The countries for the validation can be Chosen up to 30 to 31 months.

- **PCT-National Phase application:**

The national phase of a PCT application is indeed similar to a national filing in a particular country. The decision to get a patent granted in a specific nation completely depends on Patent Office of that particular nation.

- **Application for patent of addition:**

This application is filed when there is any improvement in invention in the patent which is already filed, helps to protect the improvement. It has the same expiry date as the main patent and there are no additional renewal charges for it. It can be granted after the grant of parent patent only.

- **Divisional application:**

If the patent application mentions more than more than invention, then the candidate/applicant can divide the application depending on the no. of inventions mentioned in it. It can be filed at any time in advance to getting grant of patent application. The divided applications have the same priority date as parent patent

application. The term of patent for a divisional application is 20 years from the filing date of parent application.

1.8.2 Claims

It defines the scope of invention to be protected and is the most important part of the specification of a patent. It specifies the subject matter to be protected by patent. It defines extent of security allowed by the patent therefore it is vital to get claims that encapsulate the peripheral arrangements and details that separate partner inventions. Also, claims play a key role during litigation and prosecution. Any mistake in drafting claims would result in patent that is completely useless.
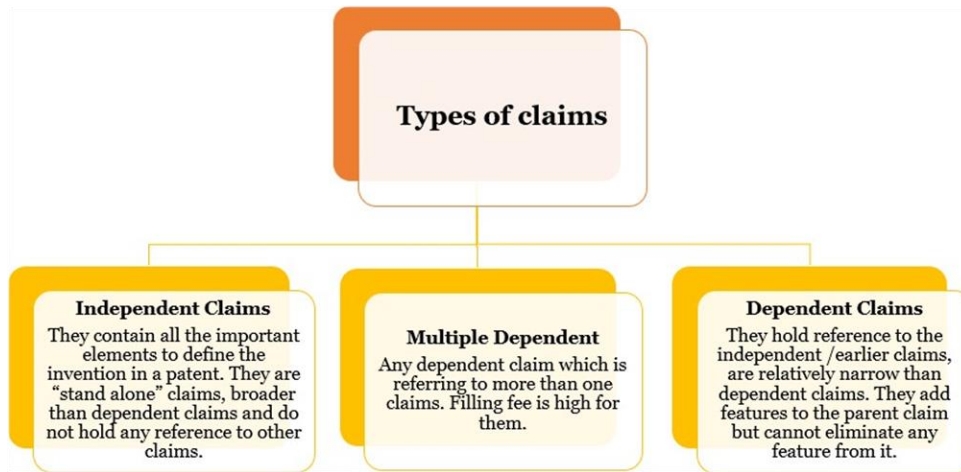

Figure-2 Types of claims

Diverse forms of Claims

- **Jepson Claims:**

It states references that link to state of prior art and then it claims some kind of improvement in that prior art. Along with describing prior art before stating an improvement, it also is not employed in domestic application but is received by USPTO. An example describing Jepson claim is "the process of making an instrument with elements A and B (prior art), wherein the improvement comprises (transitional phase) element C (the inventive element).

- **Markush Claims:**

These claims group the elements which can be alternatively used together i.e parallelly in a single claim, the elements share similar a nature and same special properties/characteristics. Inventions in chemistry, metallurgy, refractories, ceramics, pharmacology and biology are usually claimed under the Markush format. Scheme: "selected from the cluster consisting of A, B and C".

- **Reach through Claims:**

Such claims can be formed to look for protection for things that havenot yet been came across by inventor but may be discovered by making use of them by utilizing the invention. For example: If an inventor files an application for an upstream invention in a particular field, then attempts to claim for downstream invention that have not been actually made, then claims to downstream invention are referred to as reach through claims.

- **Product by process claims:**

Especially used in pharmaceutical and chemical industries wherein the product is defined by the process of its manufacture. The claim might be in this form "Output Z is produced by the procedure X". The expressions like "acquired",

"legitimately got" or an equal wording is utilized to guarantee the item by-process, it is coordinated for the item as well as gives total assurance on it.

- **Swiss type claims:**

These claims allow protection for a new subsequent therapeutic use of a known substance (secondary or further medical use). The novelty of such claims is considered to derive from the new medical purpose, not from the manufacture of the medicament. The format of Swiss claims is "The use of (compound A) for the synthesis of a medicament for the prophylactic therapy of (disease B)."

- **Omnibus claims:**

These claims refer to the drawings, description, graphics or photographs and particularly do not point out and clearly claim anything. Some examples of such claims include: "An instrument substantially described", "the test instrument shown in the drawing", "process for manufacturing a substance as described" etc. Omnibus claims can offer great advantage, an advantageous tool while drafting patent so as to maximize protection.

1.8.3 Types of Patent Searching:

S.No.	Types	Definition
1.	**Novelty/Patentability Search**	It helps the inventor to determine if any prior art (patent or non-patent literature) exists that may prevent him/her from patenting the invention.

		No date restriction exists for this search.
2.	**Freedom to Operate Search (FTO)**	Before commercializing any product/service in the market, FTO search helps the inventor to know if he/she is free to operate and commercialize the invention without violating or infringing the thirty party IP rights
3.	**Infringement Search**	Infringing of patent is the occurrence of a forbidden act in context to a patented invention without getting consent from the owner. According to various jurisdictions the meaning of patent infringement may be different but mainly it includes making or selling a product which is patented already.
4.	**Invalidation Search**	The motive of invalidation search is to either validate the claims made by an applicant in his/her patent or to invalidate one or more claims of particular patent of competitor. It is a prior art search after a patent is issued.
5.	**State of art Search**	It is done to review all of patent or non-patent literature that helps to

		know state of play in a particular technology which helps the organizations to determine future directions by understanding latest developments.

Table 1 Different types of patent searching

1.9   Patent Classification System

Patent Classification System provides an effective way of organizing patent in patent offices by technology subject which helps to retrieve document quickly and efficiently. It is an approach where patent documents are curetted and kept in a patent office so that discovery of a similar innovation or any infringement can be checked with ease.

1.9.1   Searching based on Classification

Advantages

- Does not include grammatical language.
- Changes in phrasing is not required Ideas Searching
- Available for patent reports where no full content of claims/description is accessible.

Disadvantages

- Structure of classifications is very complex. Classification rules learning is required.

1.9.2   Types of Patent Classification Systems

- **International Patent Classification (IPC)**

A widely used patent classification system which symmetrically arranges the patent documents, applicable in more than 100 countries. The Strasbourg Agreement was established it in the year 1971. It makes a different leveled progressive course of action of sans language images for the portrayal of licenses and utility models according to the various particular fields to which they have a place. All specialized information for the field of inventions is separated into sections, classes, subclasses, main groups and subgroups, in diving request of progression. Symbols are organized in a various leveled, tree-like structure: at the most elevated level are the eight sections relating to wide specialized fields (e.g., Section B manages Biomedical and life sciences); areas are additionally partitioned into classes (e.g., Class B21 deals with viral infections); classes are divided into in more than 500 subclasses (e.g., Subclass B21A deals with infections caused by Retroviruses).

- **Cooperative Patent Classification (CPC)**

It is the augmentation of the International Patent Classification and is   mutually carried on by the EPO and the USPTO. It is divided into 9 parts, A-H and Y, that are sub-divided in classes, sub-classes, groups, further into sub-groups. About 250,000 classification entries are currently present.

Objectives to launch CPC

- Helps to increase patents exploring efficiency.
- Resources distribution.

CPC to a greater extent is founded on the past European order framework (ECLA), which itself was a progressively explicit and point by point variant of the International Patent Classification framework.

- **European Patent Classification (ECLA)**

Basically, an expansion of the International Patent Classification (IPC) framework carried on by European Patent Office (EPO). Both ECLA and IPC are separated into eight areas which are additionally partitioned into classes, sub-classes, groups and sub groups. Around 135,000 classification sections are present in ECLA. ECLA classes are issued many months after classification. It can't be utilized to recover as of late distributed/gave patent reports.

Features

Extremely gifted work force: ECLA classes are just relegated by the EPO analyzing corps for example a little assemblage of profoundly prepared people keeps up the importance of the framework.

Narrow class definition: The sub groups are additionally further classifications.

Accelerated modification plans:

- It is amended even before 5 years' time of update of International patent classification.
- Non-patent literature is included in the sub group

Disadvantages

ECLA classes are given a while after grouping. It cannot be used to recover recently issuing documents.

- **US Patent Classification**

The United States Patent Classification is an official patent order framework being used and kept up by the United States Patent and Trademark Office (USPTO). Class is three-digit number and subclasses a six-digit number in which last three-digits are decimal places. Classes and subclasses are separated by a slash.

For instance: bbb/NNN.nnn

Advantages

There is a better arrangement of patents in US as compared to IPC. USPC can without much of a stretch adjust to the advances which are changing since it is overhauled more often in comparison to IPC.

Main Dates in Application of Patent

- Invention date: The date on which an invention is completed.
- Publication date: The date on which information of respective patent is accessible to the society, 18 months later than date of priority.
- Issue date: The date on which the patent is issued from the office of patent.
- Priority date: The 1st date of filling application of patent in any country.
- Filling date: The date on which application is registered with full information.
- Expiration date: Particular Date on which patent validity term terminates.

Citations: Data used in patent to refer earlier prior art.

1. Backward Citation: It is reference of patents that includes prior art
2. Forward citation: It is reference of invention completed in a particular field after issuing of patents.

Important US laws:

- USC35§112 - It specifies that invention/patent has to be fully disclosed.
- USC35§101 – It is related to utility of present invention.
- USC35§102 - It is related with the newness of the present invention.
- USC35§103 - It relates with non-obviousness of invention.

2. Problem Statement

Patent search is a crucial step for inventors, companies, and patent attorneys to identify existing patents, prior art, and potential infringements. However, the process of patent search can be time-consuming, complex, and expensive, especially when dealing with large datasets and complex technologies.

Additionally, traditional search techniques may not always be effective in uncovering relevant patents and prior art, leading to potential legal and financial risks for inventors and companies.

Techniques:

There are several techniques available for conducting patent searches, including keyword search, classification search, citation search, and semantic search. However, each technique has its limitations, and choosing the right approach can be challenging for those who lack expertise in patent search. Additionally, the

quality and completeness of patent databases can vary, which can affect the accuracy and reliability of search results.

Furthermore, the use of artificial intelligence and machine learning in patent search is still in its early stages, and there is a need for further research and development to improve the effectiveness and efficiency of patent search techniques. **Thus, the problem statement is how to improve the accuracy and efficiency of patent search techniques while reducing the cost and time involved, and how to develop and implement new approaches that leverage emerging technologies to improve the effectiveness of patent search.**

3. Objectives

Objectives of Patent Analysis:

1. Identify potential infringements: Patent analysis can help identify potential infringements by analyzing the claims and specifications of existing patents to determine if they cover similar or related technologies.

2. Evaluate patentability: Patent analysis can also help evaluate the patentability of an invention by identifying prior art and existing patents that may pose a barrier to patentability.

3. Assess competitive landscape: Patent analysis can provide insights into the competitive landscape by identifying existing patents and technologies in a particular field and evaluating the strength and breadth of patent portfolios.

4. Inform R&D and investment decisions: Patent analysis can inform R&D and investment decisions by identifying emerging technologies and market trends, as well as potential acquisition targets or licensing opportunities.

Techniques mainly used in Patent Analysis:

1. Patent Mapping: Patent mapping involves visualizing patent data to identify trends, patterns, and relationships between patents and technologies. This technique can help identify emerging technologies and market trends, as well as potential gaps in patent coverage.

2. Citation Analysis: Citation analysis involves analyzing the citations of existing patents to identify relevant prior art and potential infringements. This technique can help evaluate the strength and breadth of patent portfolios and identify potential legal risks.

3. Claim Analysis: Claim analysis involves analyzing the claims of existing patents to identify the scope and coverage of the patent. This technique can help evaluate the patentability of an invention and identify potential infringements.

4. Technology Landscape Analysis: Technology landscape analysis involves analyzing patent data to identify the key players, technologies, and trends in a particular field. This technique can provide insights into the competitive landscape and inform R&D and investment decisions.

5. Semantic Analysis: Semantic analysis involves using natural language processing (NLP) and machine learning techniques to analyze the language and meaning of patent documents. This technique can help identify relevant patents and prior art that may not be captured by traditional keyword-based search techniques.

4. Methodology

The following is the methodology used in patent analysis:

This methodology is the standard procedure in patent and analysis and patent searching.

1. Define the research question: This is the first step in patent analysis, and it involves clearly defining the research question or objective. This may involve identifying the technology area, specific patent claims or features, or other factors relevant to the analysis.

2. Identify relevant data sources: Once the research question is defined, the next step is to identify the relevant data sources. This may include patent databases such as the US Patent and Trademark Office (USPTO), European Patent Office (EPO), or World Intellectual Property Organization (WIPO), as well as scientific journals, conference proceedings, and other sources of patent and technical data.

3. Select the appropriate search techniques: There are several techniques available for patent searching and analysis, as discussed in the previous answers. Select the appropriate techniques based on the research question and available data sources.

4. Conduct the search: Conduct the patent search using the selected techniques and data sources. This may involve creating a search query using relevant keywords, patent classifications, citation data, or other search parameters.

5. Screen the results: Once the search is completed, screen the results to identify relevant patents and prior art. This may involve reviewing the abstracts, claims, and other sections of the patents to determine their relevance to the research question.

6. Analyze the results: Once the relevant patents are identified, analyze them using various techniques such as citation analysis, claim analysis, technology

landscape analysis, and others. This may involve using software tools such as patent analytics platforms, Excel spreadsheets, or other analysis tools to visualize the patent data and identify patterns and relationships between patents.

7. Draw conclusions: Based on the analysis results, draw conclusions about the patentability of the invention, potential infringements, competitive landscape, and other factors relevant to the research question. This may involve identifying gaps in existing patents, assessing the strength and breadth of patent portfolios, or evaluating the potential market value of the invention.

8. Communicate the results: Finally, communicate the results of the patent analysis in a clear and concise manner, using visualizations and other techniques to help convey the findings to stakeholders such as inventors, patent attorneys, and investors. This may involve creating reports, presentations, or other forms of documentation to help stakeholders make informed decisions based on the patent analysis.

5. Organization

Profile of the company:

GreyB is an ISO 27001 and ISO 9001:2008 licensed firm, among the major suppliers of the best quality Intellectual Property along with the support facilities. Through the years, it has been providing patent prosecution and litigation services, Patentability Searches, Invalidity/ Searches, Landscape and Whitespace Analysis, Freedom to Operate Searches etc. With the presence of its offices in two other regions in India, and Singapore. It has been delivering services to the clients in more than thirty regions globally.

To provide technology proficiency to the clients GreyB has specific departments like Life Sciences, Mechanical and Metallurgy, Electronics and

Telecommunication, Nanotechnology etc. Its prime aim is to provide robust, innovative and automated solution to the clients. Also, it offers in-house developed Intellectual Property tools that help companies to improve their performance and reduces the cost related to patent prosecution.

GreyB is among high scientific discipline corporations that has been delivering patent services to a increasing list of happy clients across the globe. With tremendously proficient and experienced experts who are working 24*7 to deliver quality results and speedy turnarounds it has been providing clients services to increase their business potency.

CHAPTER 2

LITERATURE REVIEW

Here is the literature review of few journals on patent analysis and searching techniques:

1. "Patent landscape analysis: A review of tools and techniques" by C. Wagner and K. Sternitzke, published in World Patent Information: This paper provides a comprehensive review of various tools and techniques used in patent landscape analysis. The authors evaluate the strengths and weaknesses of different approaches, including keyword searching, citation analysis, co-citation analysis, patent classification, and more. The paper also discusses the importance of patent landscape analysis in strategic decision making and provides practical guidance on how to conduct patent landscape analysis.

2. "Patent analysis for competitive intelligence using citation and co-citation analysis: A case study of the global smartphone industry" by J. Lee and J. Lee, published in Scientometrics: This paper uses citation and co-citation analysis to evaluate the patent landscape in the global smartphone industry. The authors analyze over 10,000 patents to identify the most influential patents and patentees in the industry. The paper provides insights into the competitive landscape of the industry and potential areas for innovation.

3. "Using machine learning to automate patent classification: A comparison of algorithms" by S. Sathya and S. Kamath, published in Journal of Intellectual Property Rights: This paper evaluates the effectiveness of various machine learning algorithms in automating patent classification. The authors compare the performance of several algorithms, including K-nearest neighbor (KNN), support vector machine (SVM), and random forest (RF). The paper provides insights into

the potential of AI in patent analysis and offers practical guidance on how to automate patent classification using machine learning techniques.

4. "A semantic-based patent search approach using natural language processing techniques" by A. Javed and N. Ullah, published in Journal of Intelligent & Fuzzy Systems: This paper proposes a semantic-based patent search approach that leverages natural language processing techniques to improve the accuracy and efficiency of patent search and analysis. The authors evaluate the effectiveness of their approach using a case study of patents related to renewable energy. The paper provides insights into the potential of natural language processing techniques in patent analysis and offers practical guidance on how to improve the efficiency and accuracy of patent search.

5. "Patent landscapes: A review of research and a call for action" by K. Blind and F. Mangelsdorf, published in Research Policy: This paper provides a comprehensive review of the literature on patent landscapes. The authors discuss the importance of patent analysis in innovation management and provide recommendations for future research in this field. The paper identifies several research gaps, including the need for more research on the use of patent landscapes in policymaking and the need for more comparative studies of patent landscapes across different industries and regions.

6. "Patent mining: A survey of the state of the art" by M. A. Al-Nemrat, published in World Patent Information: This paper provides a survey of the state of the art in patent mining, covering various approaches to patent search and analysis, including keyword-based search, citation analysis, topic modeling, and more. The paper also discusses the challenges and limitations of patent mining and provides practical guidance on how to overcome them.

7. "Patent valuation: A review of methodologies" by M. Kolympiris, P. Kalaitzandonakes, and N. Miller, published in Economics of Innovation and New Technology: This paper reviews various methodologies for patent valuation, including the cost, income, market, and real options approaches. The authors evaluate the strengths and weaknesses of each approach and provide practical guidance on how to apply them in practice.

8. "Patent mapping: A technique for studying technological change" by L. C. Freeman and J. S. Robertson, published in Technological Forecasting and Social Change: This paper presents the patent mapping technique, a visual representation of patent data that allows researchers to study technological change over time. The authors illustrate the use of patent mapping in several case studies and provide practical guidance on how to conduct patent mapping.

9. "Patent citation analysis: A closer look at the basic input data from patent search reports" by W. Glänzel and M. Schubert, published in Journal of the American Society for Information Science and Technology: This paper examines the basic input data used in patent citation analysis, including patent search reports, and identifies several methodological issues that can affect the accuracy and reliability of patent citation analysis. The paper provides recommendations on how to improve the quality of patent citation data and offers practical guidance on how to conduct patent citation analysis.

10. "Patent analysis for technology forecasting: The state of the art" by A. E. Porter and L. M. Cunningham, published in Technological Forecasting and Social Change: This paper reviews the state of the art in patent analysis for technology forecasting, covering various approaches to patent search and analysis, including patent citation analysis, co-citation analysis, patent classification, and more. The authors evaluate the strengths and weaknesses of each approach and provide practical guidance on how to apply them in practice.

CHAPTER 3

SYSTEM DEVELOPMENT

Introduction:

Introduction to CRMS (Hubspot):

HubSpot is a comprehensive inbound marketing and sales software platform designed to help businesses attract, engage, and delight customers. The system offers powerful tools for lead generation, customer relationship management, and marketing automation. The purpose of this system development report is to outline the process of developing a HubSpot system that meets the needs of businesses.

Requirements Gathering:

The first step in the system development process was to gather requirements from the stakeholders, including the marketing and sales teams, management, and IT staff. The requirements included the following:

1. Lead Management: The system should provide a way to manage leads and track their progress through the sales funnel. This involves capturing lead information from various sources, including web forms, landing pages, and social media, and organizing them in a centralized database. The system should also allow for lead scoring, which involves assigning values to leads based on their behavior and engagement with marketing content.

2. Email Marketing: The system should have a robust email marketing platform that enables the creation and distribution of targeted email campaigns. This involves creating email templates, designing and sending campaigns, and tracking email open rates and click-through rates.

3. Social Media Integration: The system should allow for social media integration, enabling the creation and distribution of social media posts and monitoring social media activity. This involves creating social media accounts, publishing and scheduling social media posts, and analyzing social media engagement.

4. Analytics: The system should provide detailed analytics and reporting to track the effectiveness of marketing campaigns and sales efforts. This involves creating dashboards and reports that provide insights into website traffic, lead generation, and sales pipeline.

System Design:
Based on the requirements, a system design was developed that outlined the architecture, components, and interactions of the HubSpot system. The design included the following:

1. Data Model: The system would include a data model to manage leads, contacts, and customer information. This involves creating a database schema that organizes data in a structured way and defining relationships between different types of data.

2. User Interface: The system would have an intuitive, user-friendly interface that would allow for easy navigation and configuration of marketing and sales campaigns. This involves designing and implementing a user interface that is responsive, visually appealing, and easy to use.

3. Marketing Automation: The system would provide robust marketing automation capabilities, including email campaigns, social media integration, and lead nurturing. This involves designing and implementing workflows that

automate marketing activities, such as sending follow-up emails, updating lead scores, and triggering social media posts.

4. Sales Management: The system would provide tools for managing sales pipelines, tracking deals, and managing customer relationships. This involves creating a sales dashboard that displays key metrics, such as revenue and deal velocity, and providing tools for sales reps to manage their deals and communicate with customers.

Implementation:

The HubSpot system was developed based on the system design. The implementation involved building a database, developing algorithms and analytics tools, and designing and coding the user interface. The implementation followed best practices and coding standards.

Testing:

The system was tested to ensure that it met the requirements and specifications. The testing included unit testing, integration testing, system testing, and acceptance testing. Testing was conducted in a controlled environment to ensure that the system behaved as expected under different scenarios. Test cases were created to cover all possible scenarios and to validate the system's functionality and performance.

Deployment:

Once the system was tested and validated, it was deployed in the production environment. Deployment involved configuring the system, installing the software, and setting up the database and other components. The deployment process was carefully planned and executed to minimize downtime and ensure data integrity.

Maintenance:

After deployment, the HubSpot system was maintained to ensure that it continued to meet the requirements and operated smoothly.

CHAPTER 4

EXPERIMENTS AND RESULT ANALYSIS

For experiments I will take a case study to explain patent analysis and searching techniques:

Case Study: Patent Analysis and Searching Techniques for a Biotech Company

Background:
A biotech company specializing in drug discovery and development needed to conduct a patent analysis to identify potential competitors and evaluate the patent landscape. The company had a large number of patents and patent applications, and it was becoming increasingly difficult to keep track of them all. They needed a systematic approach to analyzing and searching for patents to help inform their research and development efforts.

Objective:
The objective of the project was to conduct a comprehensive patent analysis and search to identify potential competitors and evaluate the patent landscape in the biotech industry. The company needed to identify key patents in their area of research, assess the strength of those patents, and identify potential licensing or acquisition targets.

Methodology:
The following methodology was adopted to conduct the patent analysis and search:

1. Patent Search: A comprehensive search was conducted using various patent databases, including the United States Patent and Trademark Office (USPTO) and

the European Patent Office (EPO). The search included keyword searches and classification searches to identify patents related to the company's area of research.

2. Patent Analysis: The identified patents were analyzed to identify potential competitors and evaluate the patent landscape. The analysis included identifying the key patents in the field, assessing the strength of those patents, and identifying potential licensing or acquisition targets.

3. Patent Mapping: A patent map was created to visually represent the patent landscape in the biotech industry. The patent map provided an overview of the patents and patent applications in the field, and identified areas of high patent activity and potential gaps in the patent landscape.

4. Patent Valuation: The identified patents were evaluated for their commercial value and potential licensing or acquisition opportunities. The evaluation included assessing the strength of the patents, the potential market size for the technology, and the competitive landscape.

In this case study I will use patentability search for the biotech company.

Patentability Search:

Search for patentability includes looking the prior art, which has printed patent applications, gave licenses, and the other printed records, with view of determinative whether documenting patent document/application is reasonable. A brisk patentability search in the specialized space can help settle on powerful business choices and spare a few dollars associated with patent documenting and upkeep. The reason for existing is to decide if there are any past patents or non-patents that may keep the creator from protecting their thought. A patentability search will help inside the status of partner degree application. The chase can

empower plot partner degree palatable extensiveness for the instances of a future application besides as go about as partner degree help to find that pieces of the development to focus partner degree application on.

Patentability search must be done before the documenting of a patent on the grounds that an innovation consumes a ton of endeavors and costs, so before recording, an innovator must be certain whether others have just had a special interest in that development.

Notwithstanding above,

- The patentability scan additionally gives a thought for an innovator about the extent of the development;

- Help the patent drafter to draft the case by better comprehension of the innovation over the earlier art;

- Candidate can be prepared ahead of time to offer response to the assessment dismissal which may come during its assessment stage.

Searching patent documents

A patentability search will typically include searching of significant patent assortments - United states, European, Japanese, patent cooperation treaty assortments. Albeit any prior published record can be utilized against a patent application, most patent examiners from significant patent workplaces will go directly to these assortments, so it bodes well to remember them for any patentability search, regardless of how superficial. The patent search instrument ought to be chosen in order to increase fundamental essential inclusion, however valuing is typically a limitation with shorter patentability examinations.

How Non-Patent literature searching is done

A patentability search will likewise incorporate searching of non-patent literature. Crucial sources of non-patent literature incorporating numerous specialized branches of knowledge incorporate, yet are not constrained to:

Engineering village (membership), Google, Scopus(membership), Google scholar

Specific Search Strategies

These search systems are instances of explicit accepted procedures that can be applied over the span of a patentability search.

- Always be a discuss with the client if the search is tough and there is a need to find documents that can describe alternative form or types or is the task feasible and demands only the relevant result.
- The person conducting the search should discuss with client if the search needs to be on all the claims just like the examiner will do in the patent office during filing.
- You should always search on the innovator name to know about in depth about their research interests.

At extremely starting stage, our customer will give us just smidgen data with respect to their development. They never unveil their complete innovation, yet they manage us to accomplish the relevant citation while searching through different databases.

Presently let us assume, the client has given us this much data with respect to their invention.

A form of gene therapy is used in patients with a defective type such as retinal dystrophy. Retinal dystrophy is an umbrella term for progressive eye infections. 'Retinal' means that this condition is related to the retina, which is the back layer of the eye that converts light into a clear message to the brain**.** 'Dystrophy' is a

deteriorating condition. Retinal dystrophy causes progressive degeneration or visual impairment that can eventually lead to complete blindness. This gene therapy product can be used in patients with RPE65 gene mutations. The gene therapy is a treatment based on adeno-associated virus type 2 (AAV2) in which a proper copy of the RPE65 gene is delivered without disrupting the genome. This concoction is injected directly into the retina to enter the retinal cells. When RPE65 is expressed in those cells, it can do its job and, in essence, stop the progression of the disease. AAV2 vector contains the human RPE65 cDNA with modified Kozak sequence the virus is grown in HEK 293 cells and purified for administration.

Search begins:

We will now start the search.

The search starts with understanding the novelty of the exposure. Patent analyst needs to comprehend the novelty by perusing the background and description of the exposure. In the event that he/she can't get it, at that point he/she should examine the novelty with the innovator in any case the search won't be toward the path where the creator needs it to be. So, understanding of the disclosure is must. After this the genuine search starts.

As indicated by our divulgence the novelty part is that the client sends the retransmission solicitation to the framework and the error in the message is additionally featured which as per the inventor was absent in the prior art.
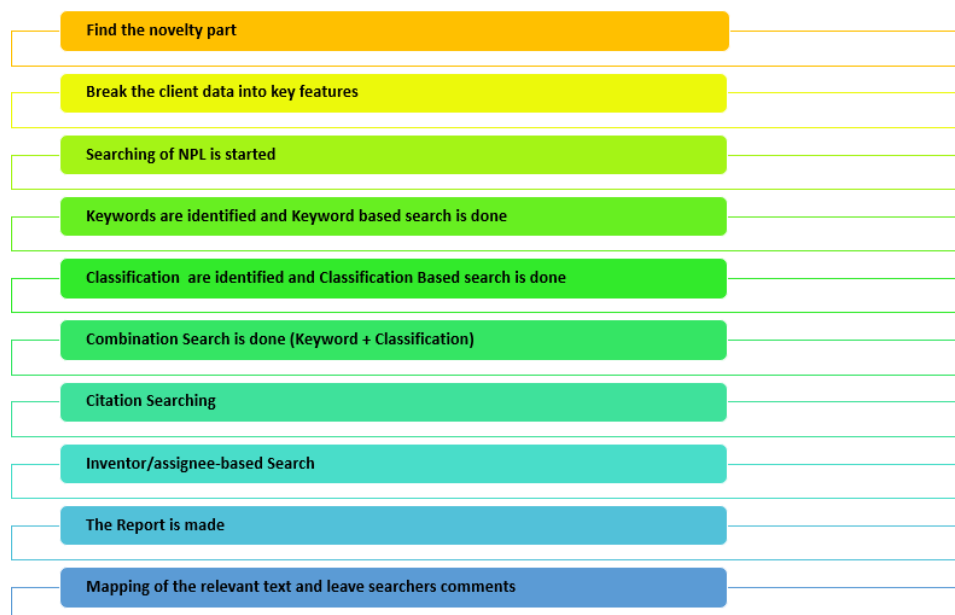

Figure-3 Steps in searching strategy

Key features of the patent(Table 2):

KF 1.	Gene therapy can be used in patients with RPE65 gene mutations to treatRetinal dystrophy.
KF 1.1	Treatment based on adeno-associated virus type 2 (AAV2) encoded with a proper copy of the RPE65 cDNA and is delivered without disrupting thegenome.

KF1.2	AAv2- RPE65 cDNA also has a modified Kozak sequence
KF 1.3	The virus is grown in HEK 293 cells and purified for administration
KF 2	Concoction injected directly into the retina to enter the retinal cells.
KF 3	When RPE65 protein is expressed in those cells, it can do its job and, inessence, stop the progression of the disease

Abstract

A method for treating an ocular disorder characterized by the defect or absence of a normal gene in the ocular cells of a human or animal subject involves administering to the subject by subretinal injection an effective amount of a recombinant adeno-associated virus carrying a nucleic acid sequence encoding the normal gene under the control of a promoter sequence which expresses the product of the gene in the ocular cells. The ocular cells are preferably retinal pigment epithelial (RPE) cells, and the gene is preferably an RPE-specific gene, e.g., RPE65. The promoter is one that can express the gene product in the RPE cells. Compositions for subretinal administration are useful in this method.

1. A method for treating a human subject having Leber Congenital Amaurosis, the method comprising: administering to said human subject by subretinal injection a recombinant adeno-associated virus (rAAV) vector comprising a nucleic acid sequence encoding a normal retinal pigment specific epithelial 65 (RPE65) gene operably linked to a chicken beta actin promoter/CMV enhancer, wherein said rAAV vector is administered in a dosage of from 1×10^9 to 2×10^{12} rAAV vector in a volume of at least 150 microliters, thereby restoring visual function in said human subject.

12. A method for treating a human subject having a mutation in the retinal pigment specific epithelial 65 (RPE65) gene, said method comprising: administering to said human subject by subretinal injection a pharmaceutical composition comprising a physiologically acceptable vehicle and a recombinant adeno-associated virus (rAAV) vector having a nucleic acid sequence encoding a normal RPE65 gene operably linked to a chicken beta actin promoter/CMV enhancer, wherein said rAAV vector is administered at a dosage in the range of 1×10^9 infectious units to 2×10^{12} infectious units at a volume of at least 150 microliters, and wherein said mutation in the RPE65 gene results in an ocular disease or disorder in said human subject and wherein administration of said pharmaceutical composition to said human subject results in an improvement to said human subject's visual function.

15. A method for treating a human subject having an ocular disease or disorder resulting from a mutation in the retinal pigment specific epithelial 65 (RPE65) gene, said method comprising: administering to said human subject by subretinal injection a pharmaceutical composition comprising a physiologically acceptable vehicle and recombinant adeno-associated virus (rAAV) vector having a nucleic acid sequence encoding a normal RPE65 gene operably linked to a chicken beta actin promoter/CMV enhancer, said pharmaceutical composition having a volume of at least 150 microliters and said rAAV vector being present in said pharmaceutical composition in an amount of about 1.5×10^{11} infectious units; wherein administration of said pharmaceutical composition results in an improvement in said human subject's visual function.

16. A method for treating a human subject having Leber Congenital Amaurosis, the method comprising: administering to said human subject by subretinal injection a recombinant adeno-associated virus (rAAV) vector comprising a nucleic acid sequence encoding a normal retinal pigment specific epithelial 65 (RPE65) gene operably linked to a chicken beta actin promoter/CMV enhancer, wherein said rAAV vector is administered in a dosage of from 1×10^9 to 2×10^{12} rAAV vector in a volume of at least 150 microliters, thereby improving said human subject's visual function.

Description

In one aspect, the invention provides a method for treating an ocular disorder in a human or animal subject characterized by the defect or absence of a normal gene in the ocular cells. The method includes administering to the subject by subretinal injection an effective amount of a recombinant adeno-associated virus carrying a nucleic acid sequence encoding the normal gene under the control of a promoter sequence which expresses the product of the gene in the ocular cells. In another aspect, the invention provides a method for treating an ocular disorder in a human or animal subject characterized by the defect or absence of a normal gene in the retinal pigment epithelial (RPE) cells of the subject. The method involves administering to the subject by subretinal injection an effective amount of a recombinant virus carrying a nucleic acid sequence encoding a normal retinal pigment epithelial (RPE) cell-specific gene under the control of a promoter sequence which expresses the product of the gene in RPE cells. In one embodiment, the gene is the RPE65 gene.

In another aspect, the invention provides a method for treating Leber congenital amaurosis in a subject by administering to the subject by subretinal injection an effective amount of a recombinant virus carrying a nucleic acid sequence encoding a normal gene under the control of a promoter sequence which expresses the product of the gene in ocular cells, wherein the cells contain a mutated version of the gene. Expression of the normal gene provides to the cells the product necessary to restore or maintain vision in the subject. In one embodiment, the cells are RPE or photoreceptor cells, and the promoters are cell-specific promoters. In still another embodiment, the invention provides a composition for treatment of an ocular disorder characterized by the defect or absence of a normal gene in the ocular cells of the subject. Such compositions comprise effective amounts of a recombinant adeno-associated virus carrying a nucleic acid sequence encoding the normal gene under the control of a promoter sequence which expresses the product of the gene in the ocular cells, formulated with a carrier and additional components suitable for subretinal injection. In one embodiment, the normal gene is RPE65. Other aspects and advantages of the present invention are described further in the following detailed description of the preferred embodiments thereof. The invention provides a method for treating an ocular disorder in a human, other mammalian or other animal subject. In particular, the ocular disorder is one which involves a mutated or absent gene in a retinal pigment epithelial cell or a photoreceptor cell. The method of this invention comprises the step of administering to the subject by subretinal injection an effective amount of a recombinant virus carrying a nucleic acid sequence encoding an ocular cell-specific normal gene operably linked to, or under the control of, a promoter sequence which directs the expression of the product of the gene in the ocular cells and replaces the lack of expression or incorrect expression of the mutated or absent gene.

Results:

The patent analysis and search yielded the following results:

1. Identification of Key Patents: The analysis identified key patents in the company's area of research, providing insights into the competitive landscape and potential licensing or acquisition targets.

2. Patent Strength Assessment: The identified patents were assessed for their strength, providing insights into potential barriers to entry and opportunities for licensing or acquisition.

3. Patent Landscape Mapping: The patent map provided an overview of the patent landscape in the biotech industry, identifying areas of high patent activity and potential gaps in the patent landscape.

4. Patent Valuation: The identified patents were evaluated for their commercial value, providing insights into potential licensing or acquisition opportunities.

CHAPTER 5

CONCLUSIONS AND APPLICATIONS

Patent analysis and searching techniques are critical tools that businesses can use to gain valuable insights into the competitive landscape, identify potential infringement risks, and evaluate the strength of their own patents. These techniques are particularly important for businesses that operate in industries with high levels of patent activity, such as the technology and pharmaceutical sectors.

A comprehensive patent analysis and search involves several key steps, including conducting a thorough search of patent databases, analyzing the identified patents to assess their strength, and mapping the patent landscape to identify areas of high activity and potential gaps. By following these steps, businesses can gain a comprehensive understanding of the patent landscape in their industry and identify potential opportunities for growth and innovation.

One of the primary benefits of patent analysis and searching is the ability to identify potential infringement risks. By conducting a thorough search of patent databases, businesses can identify patents that are similar to their own technology or products, and assess the potential risk of infringement. This information can help businesses make informed decisions about their research and development efforts and inform their intellectual property strategies.

Another key benefit of patent analysis and searching is the ability to evaluate the strength of patents. By analyzing the identified patents, businesses can assess the strength of their competitors' patents and identify potential barriers to entry. This information can help businesses develop strategies for competing in the market and identifying potential licensing or acquisition targets.

Finally, patent analysis and searching can help businesses identify potential licensing or acquisition opportunities. By evaluating the commercial value of identified patents, businesses can identify potential opportunities for licensing or acquisition that can help them expand their product offerings or enter new markets. This information can also help businesses identify potential partners for collaboration and joint development efforts.

In conclusion, patent analysis and searching techniques are powerful tools that can provide businesses with a competitive advantage in their industry. By following a comprehensive methodology for patent analysis and searching, businesses can gain valuable insights into the patent landscape, identify potential infringement risks, and evaluate the strength of their own patents. This information can help businesses make informed decisions about their research and development efforts, inform their intellectual property strategies, and identify new opportunities for growth and innovation.

Applications:

1. Pharmaceutical industry: Patent analysis and searching techniques are commonly used in the pharmaceutical industry to identify potential licensing or acquisition opportunities. Companies can analyze the patents held by other pharmaceutical companies to identify areas where they may be able to develop new drugs or treatments. This can help pharmaceutical companies save time and resources in the drug development process.

2. Technology industry: In the technology industry, patent analysis and searching techniques can be used to evaluate the strength of a company's patents and identify potential infringement risks. By analyzing the patents held by their competitors, companies can determine whether their own patents are likely to be challenged and develop strategies to protect their intellectual property.

3. Automotive industry: Patent analysis and searching techniques are also used in the automotive industry to identify potential licensing or acquisition opportunities. For example, a company may analyze the patents held by a competitor in electric vehicle technology to identify potential areas of collaboration or licensing.

4. Consumer goods industry: In the consumer goods industry, patent analysis and searching techniques can be used to identify potential infringement risks and evaluate the strength of a company's patents. For example, a company may analyze the patents held by their competitors in a particular product category to determine whether their own patents are likely to be challenged.

5. Medical device industry: Patent analysis and searching techniques are commonly used in the medical device industry to evaluate the strength of a company's patents and identify potential infringement risks. Companies can also use patent analysis to identify potential areas for new product development and licensing opportunities.

In all of these industries, patent analysis and searching techniques are critical tools for companies to gain insights into the competitive landscape, evaluate the strength of their own patents, and identify potential opportunities for growth and innovation. By using these techniques, companies can make informed decisions about their research and development efforts, inform their intellectual property strategies, and gain a competitive advantage in their industry.
