## CERTIFICATE

This is to certify that the work which is being presented in the project report titled "ROTARY INTERSECTION DESIGN AT SANJAULI CHOWK" in partial fulfillment of the requirements for the award of the degree of Bachelor of Technology in Civil Engineering and submitted to the Department of Civil Engineering, Jaypee University of Information Technology, Waknaghat is an authentic record of work carried out by Prajul Bekta (131310), Siddharth Sharma (131320), Himanshu Sharma (131654) during a period from July 2016 to June 2017 under the supervision of Mr. Abhilash Shukla, Assistant Professor, Department of Civil Engineering, Jaypee University of Information Technology, Waknaghat.

The above statement made is correct to the best of our knowledge.

Date:

Dr. Ashok Kumar Gupta
Professor \& Head of Department
Civil Engineering Department
JUIT Waknaghat

Mr. Abhilash Shukla
Assistant Professor
Civil Engineering Department
JUIT Waknaghat

## ACKNOWLEDGEMENT

It is our proud privilege and duty to acknowledge the help and guidance received from several people in preparation of this report. It would not have been possible to prepare this report without their help, cooperation and guidance.

The topic "Rotary Intersection Design" was very helpful to us in giving the necessary background information and inspiration in choosing this topic for the project. Our sincere thanks to our project guide Mr. Abhilash Shukla, for having supported the work related to this project. His contributions and technical support in preparing this report are greatly acknowledged.

We wish to thank Prof. Ashok Kumar Gupta, Head of the Department, Civil Engineering Department for all his support by the way of providing wonderful working environment and facilities for the study in general and this work in particular.

#### Abstract

In the past few years a tremendous increase in traffic has been observed everywhere. The increasing growth of vehicles has caused heavy traffic congestions on the roads and intersections, which are even worse during the traffic peak time. An intersection which is not well designed, will not only increase the travel time of the vehicles but also cause more traffic accidents. It is therefore necessary to make the design of the intersections properly. The basic principles considered for the design includes the principles of uniformity \& simplicity, minimize conflict points, and alignment of profile. A detailed survey of the study area was conducted and peak hour traffic volume was estimated through traffic volume survey. An Origin and destination survey was also being conducted and people were interviewed and the data was recorded.

In order to improve the traffic conditions at the Sanjauli Chowk (H.P.) and also to reduce the accidents at the crossing, we suggest designing the rotary at the said intersection keeping in view high traffic and conditions favouring the rotary. For this traffic volume studies and origin and destination survey is done and the design is done accordingly.

## CHAPTER 1: INTRODUCTION

### 1.1 Overview

Rotary intersections are the form of intersections that are being laid out for the movement of traffic in one direction around a central traffic island. Essentially all the major conflicts at an intersection are converted into milder conflicts namely merging and diverging. The vehicles entering the rotary are then forced to move in a clockwise direction. They then weave out of the rotary to the desired direction.Good intersection design results from a minimization of the magnitude and characteristics of the conflicts and a simplification of driver route selection process.

### 1.2Classification of Intersections

Intersections are classified as follows
(i) At Grade Intersection
(ii) Grade Separated Intersection.

### 1.2.1 Intersection at-grade

These include all roads which meet at the same level. The traffic movements such as merging, diverging and crossing are involved in the intersections at grade. The intersections at grade are further classified into two categories:

1. Channelized intersections: It is achieved by introducing islands into the intersection area in order to channelize the traffic flow into appropriate streams. Channelizing islands 'channelize' the turning traffic into appropriate paths, control the angle of approach of vehicles coming from different legs, reduce the relative speed and decrease the conflict area at the intersections.
2. Un-channelized intersections: In this, the entire intersection area is paved and there are no restrictions to the vehicles to use any part of intersection area. Suitable for very low traffic volume. They are easiest to construct in the field, but most complex in traffic operations resulting in large conflict area and more number of accidents, unless controlled by traffic signals or police.

### 1.2.2 Grade Separated Intersection

It is a bridge that eliminates crossing conflicts at intersections by vertical separation of roadways in space. Grade separated intersection are also called as Interchanges. Grade separated intersections cause less hazard and delay than grade intersections. Route transfer at grade separations is accommodated by interchange facilities consisting of ramps. Interchanges are described by the patterns of the various turning roadways or ramps. The interchange configurations are designed in such a way to accommodate economically the traffic requirements of flow, operation on the crossing facilities, physical requirements of the topography, adjoining land use, type of controls, right-of-way and direction of movements.

The ultimate objective of grade separated intersections is to eliminate all grade crossing conflicts and to accommodate other intersecting manoeuvres by merging, diverging and weaving at low relative speed.

### 1.2.3 Classification of Grade Separated Intersection

One of the distinctions made in type of interchange is between the directional and the nondirectional interchange. Directional interchanges are those having ramps that tend to follow the natural direction of movement. Non directional interchanges require a change in the natural path of traffic flow.

1. Underpass
2. Overpass
3. Trumpet Interchange
4. Diamond Interchange
5. Cloverleaf Interchange
6. Partial Cloverleaf Interchange
7. Directional Interchange
8. Bridged Rotary

## CHAPTER 2: Rotary Intersection

A rotary intersection is an enlarged road intersection where all the vehicles that are converging have to move around a central island in a particular direction before they can weave out of traffic flow into their respective directions radiating from the central island.

Fig1.Traffic manoeuvres in a rotary

### 2.1 Advantages of Rotary Intersection

1. In a rotary intersection flow of traffic is regulated to only one direction of movement, hence eliminating severe conflicts between crossing movements.
2. All the vehicles entering the rotary are gently forced to reduce the speed and continue to move at slower speed. Thus, none of the vehicles need to be stopped, which is the case in a signalized intersection.
3. As speed of negotiation is lower and due to elimination of severe conflicts, accidents and their severity are much less in rotaries.
4. Rotaries are self-governing and usually these rotaries do not need practically any control by police or traffic signals.
5. They are ideally suited for moderate traffic, especially with irregular geometry, or intersections with more than three or four approaches.

### 2.2 Limitations of Rotary Intersection

1. As all the vehicles are forced to slow down before they negotiate the intersection there is a delay which will be much higher than channelized intersection.
2. The vehicles are forced to reduce their speed even when there is relatively low traffic.
3. Rotaries require large area of relatively flat land making them costly at urban areas.

### 2.3 Guidelines for the selection of rotaries

1. Rotaries are suitable when the traffic entering from all the four approaches are relatively equal.
2. A total volume of about 3000 vehicles per hour can be considered as the upper limiting case and a volume of 500 vehicles per hour is the lower limit.
3. A rotary is very beneficial when the proportion of the right-turn traffic is very high; typically if it is more than 30 percent.
4. Rotaries are suitable when there are more than four approaches or if there is no separate lanes available for right-turn traffic.

### 2.4 Traffic operations in a rotary

As noted earlier, the traffic operations at a rotary are three; diverging, merging and weaving. All the other conflicts are converted into these three less severe conflicts.

1. Diverging: It is a traffic operation when the vehicles moving in one direction is separated into different streams according to their destinations.
2. Merging: Merging is the opposite of diverging. Merging is referred to as the process of joining the traffic coming from different approaches and going to a common destination into a single stream.
3. Weaving: Weaving is the combined movement of both merging and diverging movements in the same direction.

Fig2. Traffic operations in a rotary

## CHAPTER 3: LITERATURE REVIEW

Road intersections are a critical element of road sections .Design of a safe intersection depends on many factors. The major factors can be classified as under:

1. Human Factors.
2. Traffic Considerations.
3. Road and Environmental Conditions.

The human factors include driving habits, driver's ability to make decision. The traffic considerations include design and actual capacities, design hour turning movement, size and operating characteristics of vehicles, vehicle speed, and traffic mix. The road and environmental conditions include character and use of abutting property, sight distance, and conflict area, area of intersection, geometrical features and traffic control devices.
In the design of an intersection, the primary considerations are safety, smooth and efficient flow of traffic. The basic principle of design includes the principles of uniformity \& simplicity; minimize conflict points, safety, and alignment \& profile. In order to be able to properly design an intersection and give consideration to factors affecting design, index location plan showing the intersection under consideration, base plan of intersection, peak hour design traffic data (Traffic Volume data, number of PCUs per hour), accident data at intersection as per IRC:531982.

The entire design methodology is based on the steps from IRC-65:1976. The method of conversion of traffic volume into PCU has been referred from SP-41:1994. The various methods and techniques of surveying in hilly areas will be as per those mentioned in SP-48:1998.

IRC-52:2001 is used for hilly roads for determining the design speed for hilly roads and various design parameters used for hilly roads.

## CHAPTER 4: NEED FOR ROTARY INTERSECTION

From site observations, we see that the intersections are uncontrolled intersections. There are no proper pavement markings, physical dividers like medians, channelizing islands, traffic signals and no pedestrian facilities like footpath, cross walk etc. intersections. The vehicles are not parked properly which worsen the situation during peak hours and leads to extreme congestion in the area. There are encroachments by people on the roads at the study area and temporary vendors like tea stalls, on the intersection. Keeping in view these prevailing conditions in the study area it is clear that proper channelizing of traffic is required in this area as all these factors have an adverse impact on road user's behavior which enhances the possibility of accidents. Therefore it becomes important to design a rotary at Sanjauli Chowk to curb these problems.

## CHAPTER 5: OBJECTIVES

a) To carry out traffic volume study.
b) To carry out Origin and destination Survey.
c) To design the intersection on the basis of outcomes of traffic volume survey.
d) To design the rotary intersection using Auto Cad software.
e) To design the rotary intersection using Revit software

## CHAPTER 6: SCOPE OF THE PROJECT

The scope of this project is to design an efficient rotary intersection to deal with the increasing traffic volume and reduce the number of conflicts and accidents at the junction of Sanjauli Chowk .The project aims to determine the capacity of the intersection in terms of traffic volume and design the traffic rotary.

## CHAPTER 7: STUDY AREA

The area of study for this project is Sanjauli Chowk, district Shimla, H.P. There exists a fourway intersection in which one road stretches from Nav Bahr towards Sanjauli, second from Sanjauli Chowk to IGMC, the third towards Lakkar Bazaar and fourth toward Dhalli. The traffic study conducted at the site shows that there exists a large traffic volume at the junction and there is no proper channelized intersection. This creates a problem for different traffic movements and increases the chances of conflicts which may lead to accidents.

Fig 5. Sanjauli Chowk

CHAPTER 8: FLOWCHART OF PROJECT ACTIVITIES

## CHAPTER 9: TRAFFIC VOLUME STUDY

The traffic survey was conducted in three phases:
Phase 1: Monsoon Season
Phase 2: Winter Season
Phase 3: Summer season
Traffic study was done on week days and weekends. The traffic volume was analysed manually and the average traffic volume was calculated by taking into account the PCU values for different automobiles as suggested by IRC.

| SNo. | Vehicle Type | Equivalent Factor |
| :--- | :--- | :--- |
| 1 | Motor Cycle, Scooter or Cycle | 0.5 |
| 2 | Passenger car, Van or Auto-Rickshaw | 1.0 |

## CHAPTER 10: ORIGIN AND DESTINATION STUDIES

The origin and destination is mainly carried out to plan the road network and other facilities for vehicular traffic. The O\&D study of vehicular traffic determines their number, their origin and destination in each study zone. The data is also supplemented by number of people in each vehicle, intermediate stops made and reasons etc. Origin and destination study gives information like actual direction of travel, selection of route, time usually taken to reach destination etc. These studies are important in improving some existing systems as well as planning new highway facilities.

There are a number of methods that can be employed for collecting O\&D data. Some of the commonly adopted methods are:-

1 Road side interview method.
2 License plate method.
3 Return post card method.
4 Tag on car method.
5 Home interview method

During this project O\&D study was being carried out. In this, survey was done on more than 50 people where the method employed was road side interview method and home interview method. After performing the survey certain results were obtained.

## OBSERVATIONS FROM O\&D STUDY

Question - What was the most travelled route for people?

Answer - It was found out to be from B to D and D to B, because most people have their Workplace as well as schools located over there.

Question - What is the most severe problem people are facing in the area?
Answer - It was found out that people have started the experience severe traffic jams in the Area. This was mainly due to congestion.

Question - What is the time delay for people now days?
Answer - The increase in time delay is about $200 \%$. There are stagnant traffic jams and to cover just 1 km it takes $15-20$ minutes now.

Question - What do people think is the cause for this?
Answer - According to the locals residing there, the main cause behind this is local bus drivers who are mainly responsible for these traffic jams along with poor traffic management by the police.

Question - Some other problems people have started facing recently?
Answer - According to the survey it was found out that number of accidents have increased in the area.

## CHAPTER 11: THEORETICAL DESIGN OF ROTARY

A theoretical design of traffic rotary for Sanjauli Chowk is being prepared keeping in view the IRC recommendations for hilly terrain and the given design is prepared

| SNO. | PARTICULARS | Value |
| :--- | :--- | :--- |
| 1 | Shape of the central island | Circular |
| 2 | Design speed for mountainous terrain | 30 kmph |
| 3 | Minimum radius of horizontal curve | 15.07 m |
| 4 | Value of friction coefficient | 0.47 |
| 5 | Radius of entry curve | 15 m |
| 7 | Radius of exit curve | 22.5 m |
| 8 | Width of entry (e $\mathrm{e}_{1}$ ) | 6.5 m |
| 9 | Width of non-weaving section (e $\mathrm{e}_{2}$ ) | 6.5 m |
| 10 | Length of weaving section (L) | 10.0 m |
| 11 | Weaving Ratio (P) | 40.0 m |
| 12 | Practical Capacity of Rotary | 0.6 |

## CHAPTER 14: PROJECT SCHEDULE

| SNO. | ACTIVITY | TIME TAKEN |
| :--- | :--- | :--- |
| 1 | Literature Review | August 2016 |
| 2 | Preliminary site survey | August-September 2016 |
| 3 | Traffic volume study(part1) | September2016 |
| 4 | Origin and Destination study | October 2016 |
| 5 | Traffic volume study(part2) | November - <br> December2016 |
| 6 | Drawing Layout | January 2017 |
| 7 | Traffic volume study(part3) | February-March 2017 |
| 8 | Analysis by Software | March-April2017 |

Table 57

## CHAPTER 15: OBSERVATIONS \& CONCLUSIONS

The following observations and conclusions were obtained from the project:-
1 The peak hour traffic volume of the intersection was found out to be 2957 PCU per hour. This volume of traffic area study area requires appropriate handling of traffic that can be achieved by designing of traffic rotary at Sanjauli Chow

2 The maximum volume that a traffic rotary can handled efficiently can be taken as about 3000 vehicles per hour entering from all intersection legs.

3 Necessary widening on all the legs of the intersection should be provided

4 Intersections should be provided on a level ground.

5 Traffic rotary construction reduces the area of conflict between intersecting traffic streams and promotes orderly and safe movement

6 For better working of traffic rotary encroachments have to be removed on all the legs of intersection.

7 The adequate lighting of intersections especially with channelizing islands is essential in urban areas. Lighting should be done as to make the entire island and intersection area visible even in bad weather

8 The parking of vehicles must not be allowed at the intersections.

9 Necessary traffic signs and pavement markings need to be provided at the intersection. Also, signs with reflective properties, preferably retro reflective type, are to be used so as to meet the requirements of night traffic.
